

Privacy Policy

Effective date	[EFFECTIVE DATE]
Last updated	[EFFECTIVE DATE]
Applies to	Tactura for iPadOS, version 1.0 and later
Publisher	[DEVELOPER LEGAL NAME]

This Privacy Policy explains how [DEVELOPER LEGAL NAME] (“we”, “us”) handles information in connection with **Tactura**, an iPadOS application that converts a two-dimensional image into a 2.5D relief model suitable for 3D printing.

It is short, and it is short for a reason: **Tactura has no servers, no accounts and no network code.** Everything the app does with your images happens on your iPad.

The one-sentence version

Tactura does not collect, transmit, sell or share any personal data. Your artwork is analysed by an artificial-intelligence model that runs entirely on your own device, and it never leaves that device unless you deliberately export a file.

1 Summary at a glance

Question	Answer
Do you collect personal data?	No.
Do you require an account or sign-in?	No.
Does the app connect to the internet?	No. It contains no networking code.
Are my images uploaded anywhere?	No. They are processed on your iPad.
Where does the AI run?	On your device, on Apple silicon.
Is my artwork used to train AI models?	No. Never.
Do you use analytics, ads or trackers?	No. There are no third-party SDKs.
Do you sell or share my data?	No. There is nothing to sell or share.
Can I use the app offline?	Yes, entirely.
Apple “App Privacy” declaration	Data Not Collected.

2 The AI model runs on your device

This is the most important thing to understand about Tactura, so it comes first.

Converting a flat image into a relief requires estimating how far every pixel of that image is from the viewer — a task called **monocular depth estimation**. Most applications that do this send your picture to a remote server, run a model there, and send a result back. Tactura does not. The model is embedded in the application itself and executes locally.

2.1 What is actually running

- Tactura bundles **Depth Anything V2 Small**, a compact vision-transformer depth model published by Apple in **Core ML** format at half precision.
- The model file ships *inside* the app you download from the App Store. There is no separate download step, no model server and no licence check.
- Inference is dispatched by Core ML to the **Apple Neural Engine** and the other processors on your iPad. Your image is read from the app's own storage, passed to the model in memory, and the resulting depth map is written back to the app's own storage.
- If the bundled model cannot be loaded for any reason, the app falls back to a purely classical image-processing method. That fallback is also entirely local — there is no remote path in either case.
- Every other stage of the conversion pipeline — image preparation, depth correction, region segmentation, volume construction, layer blending, mesh generation and file export — is likewise computed on your iPad using code compiled into the app.

2.2 What this means for you in practice

- **Your images are never transmitted.** Not to us, not to a cloud inference provider, not to Apple, not to anyone. The application contains no code capable of making a network request with your content.
- **Nothing you make is used for training.** We do not receive your artwork, your prompts, your settings or your results, so none of it can be, or ever will be, used to train or fine-tune any machine-learning model.
- **The app works with no connection at all.** You can put the iPad in Airplane Mode and every feature — capture, crop, convert, refine, export — continues to work identically. This is a straightforward way to verify the claims on this page for yourself.
- **No usage telemetry is produced.** We do not know how often you open the app, what you convert, how long a conversion took, or whether it succeeded.
- **The trade-off is honest.** On-device inference uses your iPad's processor, battery and storage. A conversion is computationally heavy; the device may warm up and battery use during a conversion is noticeable. We consider that an acceptable price for your work staying yours.

3 Information the app can access on your device

Tactura asks your iPad for access to three things, each only at the moment you use the corresponding feature, and each governed by iOS's own permission system. You can review or revoke every one of them at any time in **Settings** → **Privacy & Security**, or in **Settings** → **Tactura**.

3.1 Camera

If you choose to photograph your artwork inside the app, iPadOS asks for camera permission the first time. The camera preview is rendered locally and the still image you capture is saved into the app's private storage as the source image for that project. Tactura does not record

video, does not capture audio, does not use the camera in the background, and does not transmit any frame anywhere. Declining camera access disables only the in-app capture screen; importing from your photo library still works.

3.2 Photo library

If you import an existing image, Tactura presents the standard iPadOS photo picker. That picker is provided and run by the operating system, not by us. Tactura receives *only* the single image you select. The app is not granted the ability to browse, search, enumerate or read the rest of your photo library, and it does not request full-library access.

3.3 Files, when you export

When you export a model, Tactura shows the system document picker so you can choose a destination folder — on the iPad, in iCloud Drive, or in another provider you have installed. iPadOS grants the app temporary, scoped permission to write into the folder you picked, and nothing else. Tactura writes the single file you asked for and nothing more. If you choose a destination synchronised by a cloud service, that service's own privacy policy governs the copy you placed there; that is your choice and outside our control.

4 What Tactura stores, and where

All application data lives inside Tactura's sandbox on your iPad — a private area that other apps cannot read, protected by iOS Data Protection and the device's hardware encryption whenever the device is locked.

What	Why it exists
Project record	The project's name, its creation and modification dates, and the conversion settings you chose.
Source image	The photograph or imported picture the project was made from, kept so you can revisit and re-convert a project later.
Checkpoint file	The intermediate result of the expensive analysis stages, cached so that adjusting a slider does not re-run the AI model. It is regenerable, and is deliberately excluded from device backups.

There is no hidden log, no crash-reporting bundle, no advertising identifier and no usage database. We hold no copy of any of the above, because none of it is ever sent to us.

4.1 Retention and deletion

Your data is retained on your device for exactly as long as you want it. Deleting a project inside the app removes that project's folder and everything in it. Deleting Tactura from your iPad removes all of its data. Because we store nothing, there is no server-side copy to request the deletion of and no retention period on our side.

4.2 Backups

If you have enabled iCloud Backup or you back up your iPad to a computer, the project records and source images inside the app's storage may be included in that backup, in the same way as data from any other app. Those backups are made, encrypted and controlled by Apple under Apple's terms and privacy policy — we have no access to them. The large regenerable checkpoint files are explicitly marked to be excluded from backups.

5 No third-party data collection

Tactura contains no analytics framework, no crash-reporting service, no advertising network, no attribution or “growth” SDK, no social-media integration and no third-party service that receives data about you.

The app does incorporate third-party *software components* — an image-processing library, the depth model described in Section 2, and a mesh-simplification routine. These are compiled into the application and execute locally. None of them collect information, and none of them communicate with any network service. They are listed, with their licences, in Tactura's Terms and Conditions.

We do not sell personal information. We do not share personal information for cross-context behavioural advertising. We do not disclose personal information to anyone, for any purpose, because we do not receive any.

6 Children's privacy

Tactura is a general-audience creative tool and is suitable for all ages. It collects no personal information from anyone, including children, and therefore collects none from children under 13 (or the equivalent age of digital consent in your country, which is between 13 and 16 across the European Union). There is no sign-up, no profile, no messaging, no user-generated-content feed and no advertising in the app. Tactura is not directed at children in a manner that would make it subject to the U.S. Children's Online Privacy Protection Act (COPPA) as an operator collecting children's data, because no data is collected at all.

7 Your rights under data-protection law

Data-protection law across the world gives you rights over personal data that an organisation holds about you. Those laws include the EU General Data Protection Regulation (GDPR) and the UK GDPR, Indonesia's Personal Data Protection Law (Undang-Undang No. 27 of 2022, *Pelindungan Data Pribadi*), the California Consumer Privacy Act as amended by the CPRA, Brazil's LGPD, Canada's PIPEDA, Australia's Privacy Act, Japan's APPI, South Korea's PIPA, and comparable statutes elsewhere.

In each case those rights attach to data that we, as an organisation, process about you. **We process none.** We are not a controller or a processor of your personal data in connection with your use of Tactura, because no personal data reaches us. There is accordingly no international trans-

fer of your data, no automated decision-making carried out by us, no profiling, and no third-country recipient.

Applied to Tactura, your rights work out as follows:

Right	How it is satisfied
Access / portability	Your data is already in your possession. Export any project as a standard <code>.stl</code> or <code>.png</code> file at any time.
Rectification	Edit or re-convert a project directly in the app.
Erasure	Delete a project, or delete the app. Nothing survives elsewhere.
Restriction / objection	Revoke camera or photo access in iOS Settings, or stop using the app.
Withdraw consent	Revoke the relevant iOS permission at any time; the app continues to function without it.
Non-discrimination	Every feature is available to every user. There is no paid tier that trades features for data.
Complaint	You may complain to your national supervisory authority — in Indonesia, the authority designated under UU PDP; in the EU or UK, your local data-protection authority.

If you would like this confirmed in writing for your own records, write to us at the address in Section 10 and we will respond.

7.1 A note for California residents

In the twelve months preceding the effective date of this policy, we have not collected, sold or shared any category of personal information listed in the CCPA. We have no “Do Not Sell or Share My Personal Information” link because there is nothing to opt out of.

8 Security

Because Tactura keeps everything local, its security posture rests on your device’s own protections, which are substantial:

- Application data is stored inside the iOS sandbox, which prevents other applications from reading it.
- Files are protected by iOS Data Protection and are encrypted at rest by the device’s hardware while the device is locked.
- The app is distributed exclusively through the App Store and is code-signed; iPadOS verifies that signature before it will run.
- There is no attack surface in the form of an account, a password, a session token, an API key or a server, because none of those exist.

The practical advice that follows from this is ordinary but worth stating: protect your iPad with a passcode or Face ID, keep iPadOS updated, and remember that anyone with access to your

unlocked device has access to your projects.

9 Changes to this policy

If Tactura ever gains a feature that changes the answers above — for example an optional cloud backup, or crash reporting — we will update this policy before that feature ships, revise the “Last updated” date at the top, and describe the change in the App Store release notes for the version concerned. Material changes that would involve collecting personal data will be presented to you in the app, and will require your explicit opt-in. We will not quietly begin collecting data under an old policy.

Previous versions of this policy remain available on request.

10 Contact

Questions about this policy, or about privacy in Tactura generally, are welcome.

Data controller / publisher [DEVELOPER LEGAL NAME]
Email [CONTACT EMAIL]
Postal address [POSTAL ADDRESS]
EU / UK representative [IF APPLICABLE — OTHERWISE DELETE THIS LINE]
Support [SUPPORT URL]

We aim to reply to any privacy enquiry within 30 days, which is the response window required by the GDPR and by most comparable statutes.

This policy covers the Tactura application only. It does not cover the App Store itself, iCloud, or any third-party service you may choose to export a file into — each of those is governed by its own provider's privacy policy.
